

How to upload a video with dual feeds to Media Hopper Create

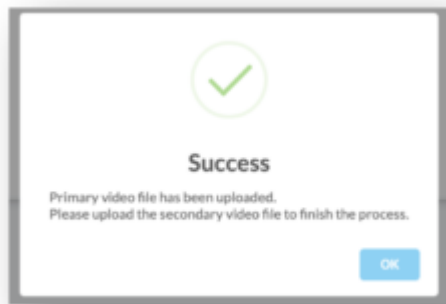

If you need to upload a video with two feeds (e.g. lecture slides and lecturer cam) to Media Hopper Create, this is possible through <https://videomigrator.is.ed.ac.uk>. When a video has dual feeds on Media Hopper Create, the user has full control over the size and location of both feeds while they watch the video. This is very useful for dynamic lecture videos when the focus changes between the two feeds and ensures the user can move the secondary feed out of the way of the main feed when needed. To upload a dual feed video:

1. Log in to the media migrator and choose the primary video file (the video feed that will be larger by

default).

2. Create a title for this file (this title will be the one that appears for both feeds) and upload the primary video file.
3. After the primary video file has completed upload you will receive a success message.

4. You can now repeat this process to upload the second feed (the smaller feed that will hover on top).
5. The second feed also requires a title but this will not appear on the final video page.
6. The video with dual feeds will appear on your 'My Media' section on Media Hopper Create where you can then edit the video details and [publish](#) it.
