

Revisiting the prefix/suffix asymmetry: Experimental evidence from Kĩitharaka *(...and English and Mandarin...)*

Workshop on prefixes versus suffixes in Afroasiatic

Alexander Martin, 12/03/2022

Talk outline

Introduction

- 1. Testing the ‘suffixing preference’ in English and Kĩĩtharaka**
- 2. Testing the ‘suffixing preference’ in Mandarin**
- 3. Pitting processing accounts against each other**

Discussion

Explaining typological regularities

Typology is shaped by a multitude of factors:

- Linguistic system (e.g., domain-specific representations)
- Cognition (e.g., domain-general biases)
- Cognition-external factors (e.g., history, geography)

Cognitive hypotheses make **testable predictions!**

Crucially, predictions should be borne out **across linguistic populations**

The ‘suffixing preference’

Classification	Nb. of languages
Little affixation	141
Strongly suffixing	406
Weakly suffixing	123
Equal prefixing and suffixing	147
Weakly prefixing	94
Strongly prefixing	58
Total	969

**Preference for
suffixes = 55%**

**Preference for
prefixes = 16%**

(Dryer 2013; Hawkins & Cutler 1988; Hupp et al. 2009)

Label extension task (Bruening et al. 2012)

This is a *manse*:

Which one of these is a {*ko-manse*, *manse-ko*}?

Label extension task (Bruening et al. 2012)

This is a *manse*:

Which one of these is a {*ko-manse*, *manse-ko*}?

English-speaking children *and* adults more readily extended labels with suffixes than those with prefixes.

This is a *pefi*.

这是*pefi*.

Here are two items. Which one is a $\{pefizo, zopefi\}$?

下面 有两个图形, 哪一个 是 $\{pefizo, zopefi\}$?

(Wang & Kastner 2020)

This is a *pefi*.

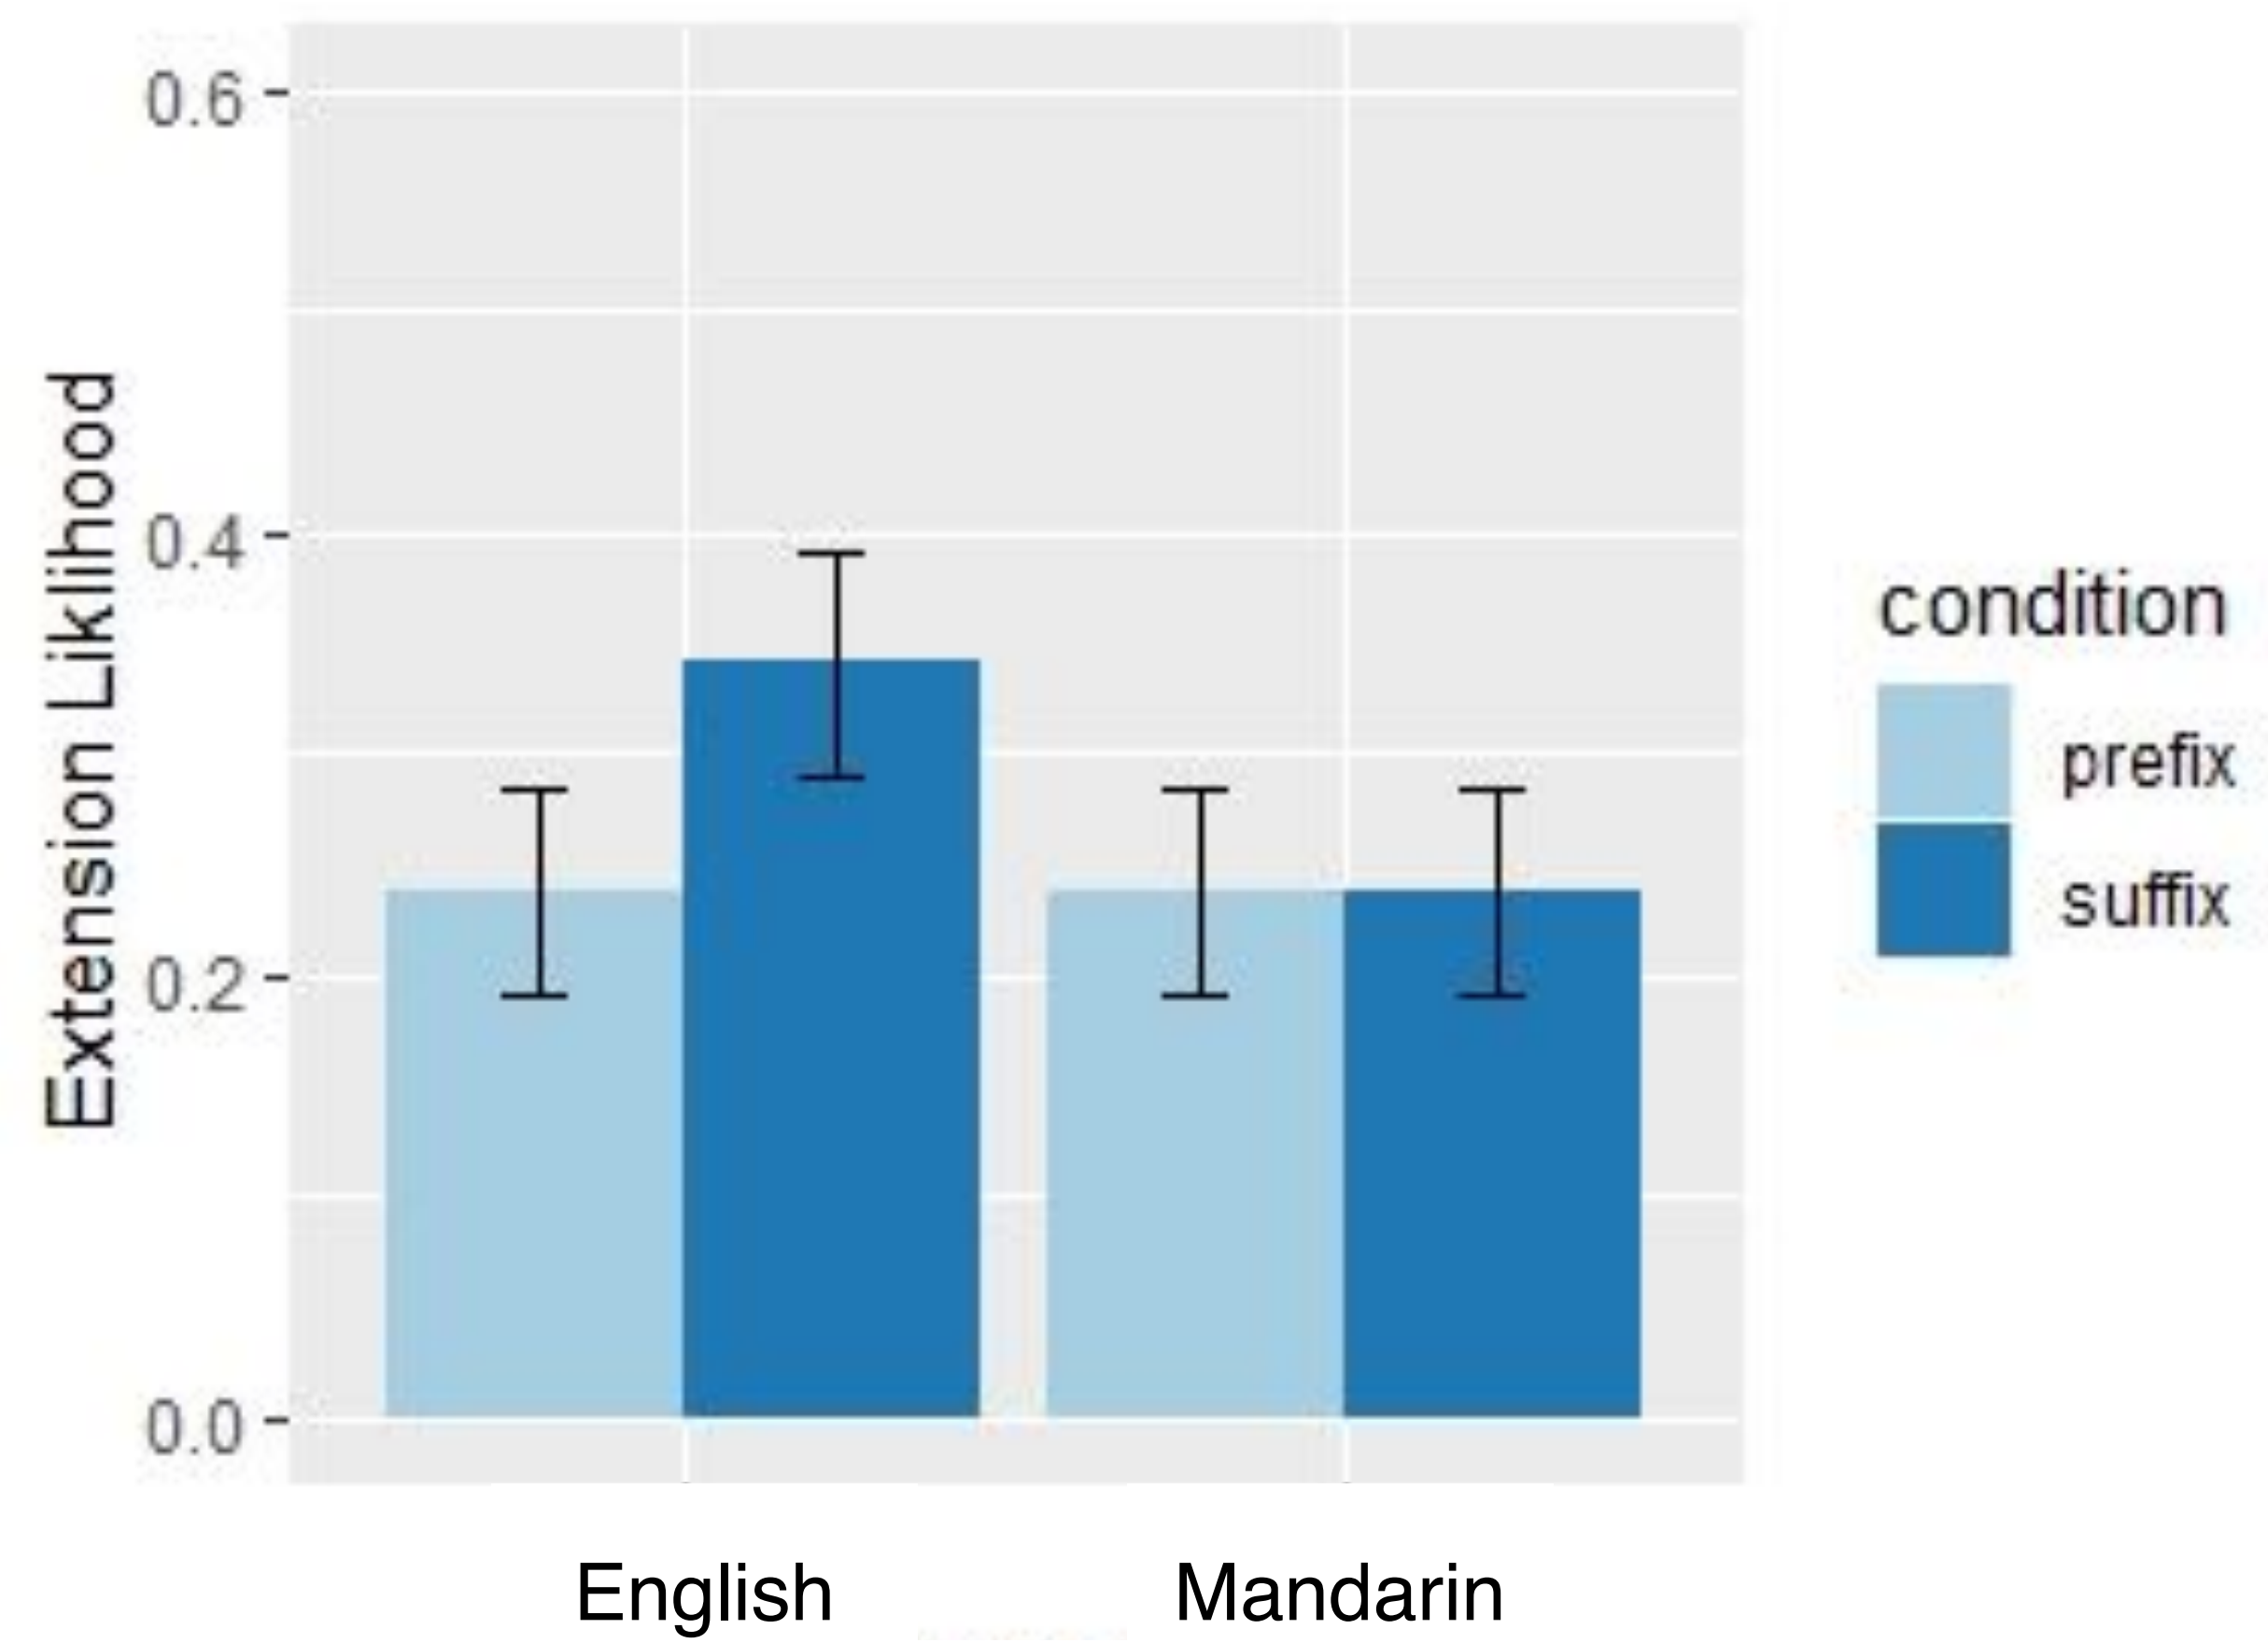

这是*pefi*.

**How often do participants extend the label
(i.e., choose the same shape)?**

(Wang & Kastner 2020)

So English-, Kĩĩtharaka-, and Mandarin-speaking participants' responses are in line with the affixation patterns of their native language...

Are prefixes so detrimental to word recognition?

Discussion

- **English, Kĩtharaka, and Mandarin** speakers' preferences align with L1 affixation patterns:
 - Suffixes preferred for English speakers
 - Prefixes preferred for Kĩtharaka speakers
 - No preference for Mandarin speakers
- Prefixes might be helpful too: preceding grammatical information is useful [LTR]
(Van Heugten & Shi 2009)
 - ...Unless listeners hold prefixes in memory and wait for the stem [discontinuous]
 - Stay tuned for our next study!
- Alternative accounts:
 - Constraints on prosodic phrasing (Himmelman 2014)
 - Contact (Guzmán Naranjo & Becker 2020)

Returning to typological regularities...

Typology is shaped by cognitive *and* non-cognitive factors...

Cognitive hypotheses make **testable predictions** that can be explored experimentally.

Crucially, **cross-linguistic** studies are necessary to make any claims about universality!

Thank you
