Contents

- The difficulty of dry forests
- The Satellite Monitoring for Forest Management (SMFM) project
- SMFM tool 1: Flood mapping with Sentinel-1 in Central Mozambique
- SMFM tool 2: Charcoal production near Maputo with ALOS PALSAR

The difficulty of dry forests

- Dry forests and savannas are globally extensive: $\frac{1}{2}$ the tropics, 23 M km²; $\frac{3}{4}$ of the people (Ryan et al 2016)
- Rates of conversion are probably very rapid (McNicol et al. 2018), with high demand for their goods and services.
- Many existing forest monitoring tools perform poorly in dry forests

The difficulty of dry forests

Phenology

The difficulty of dry forests **Heterogeneity**

The difficulty of dry forests

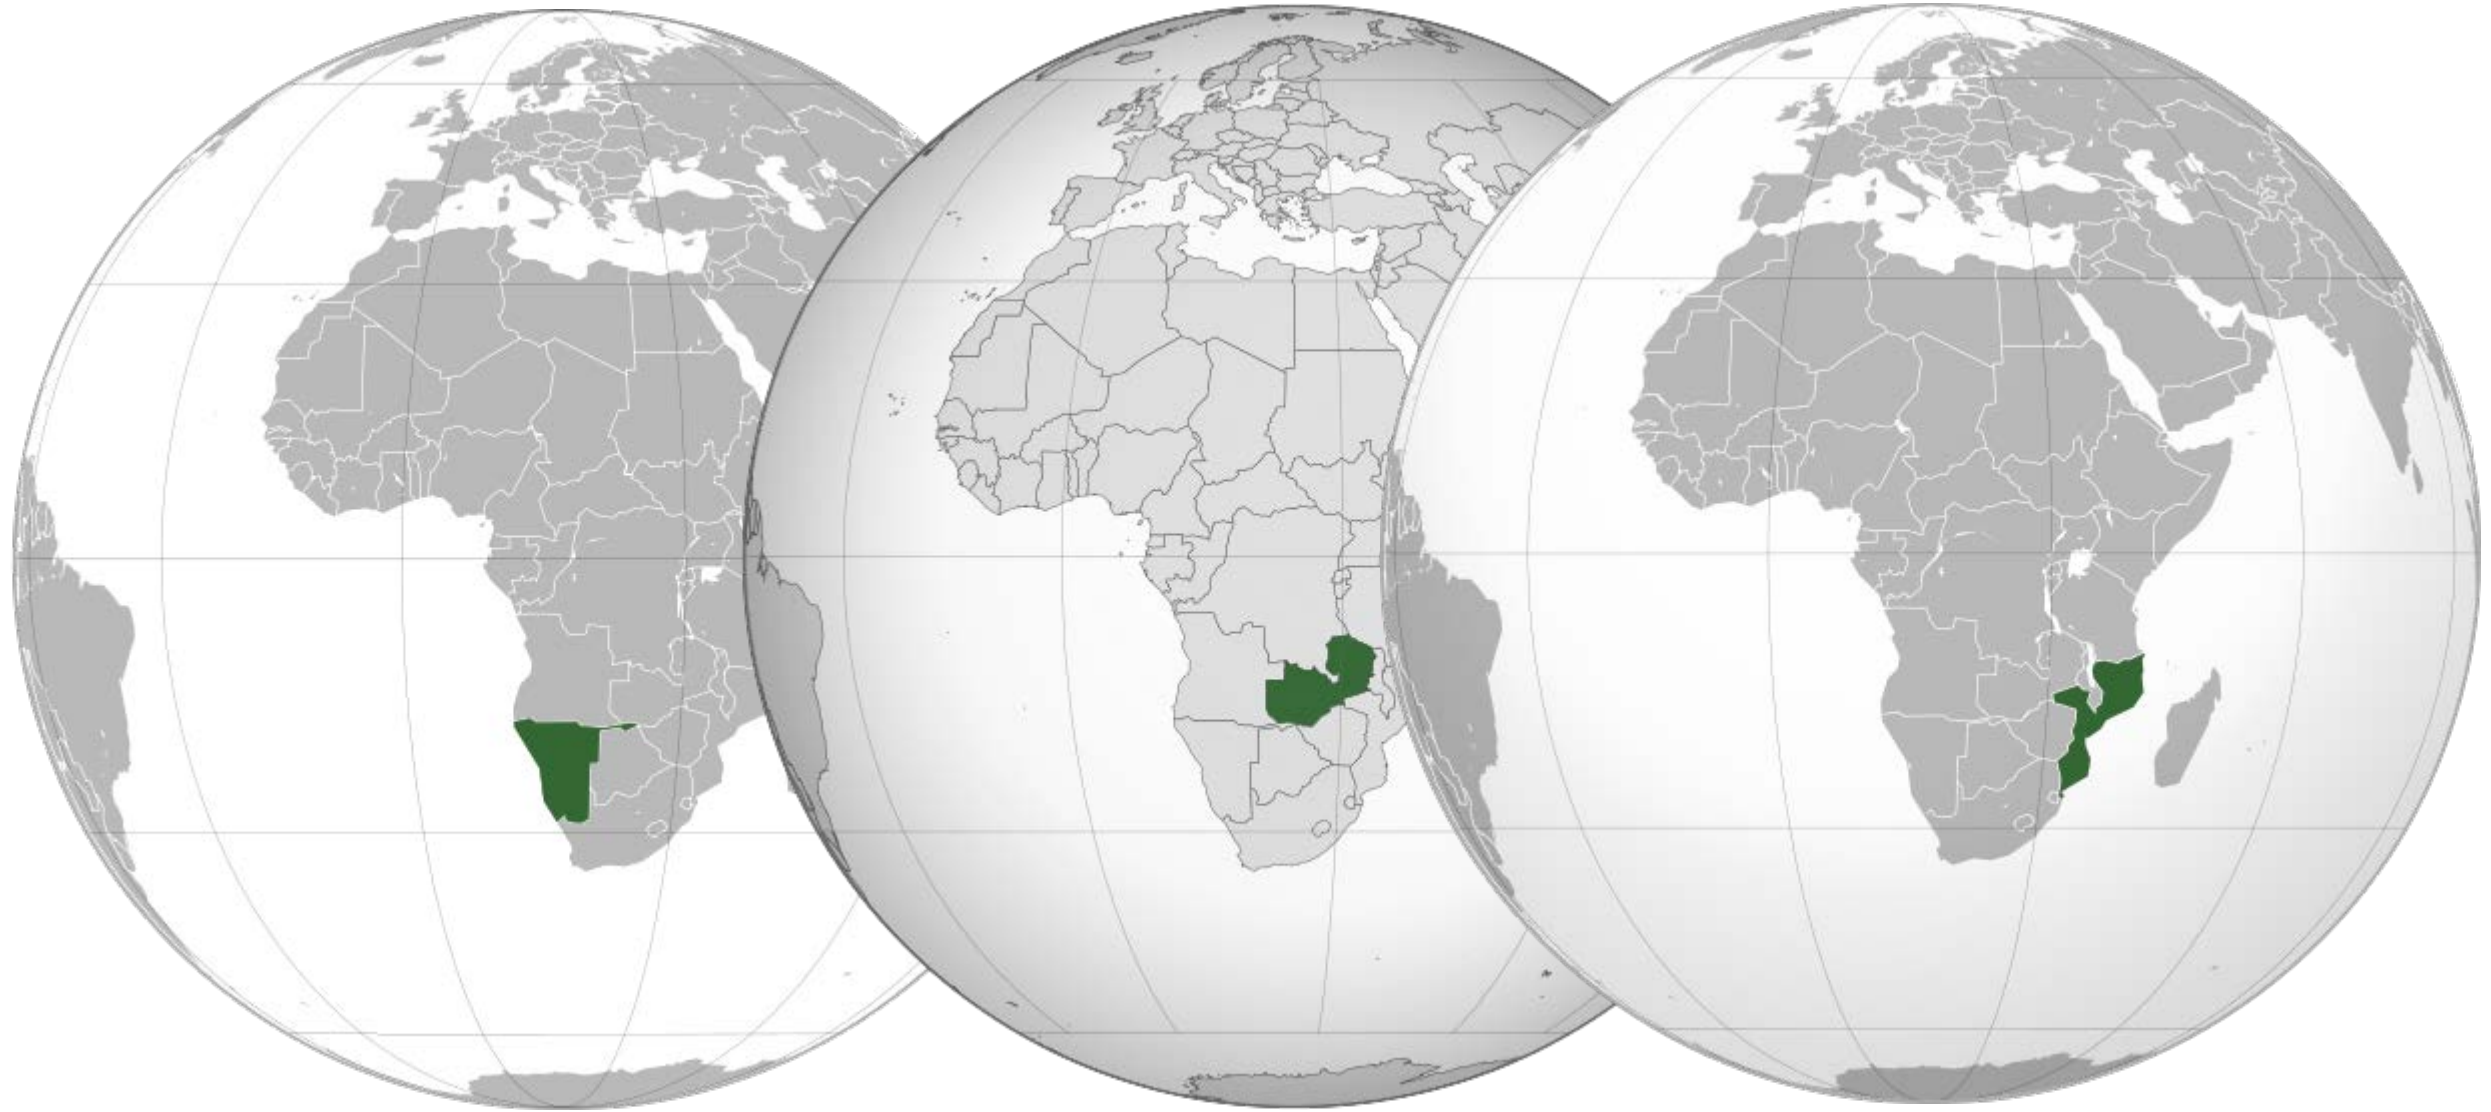

Fire

The SMFM Project

- Recent advances in **satellite Earth Observation (EO) data provision** provide **free access to satellite data**
 - Higher resolution
 - Higher frequency
 - Optical and Radar
- However **improved EO methods are required** to take advantage of these new data in dry forests
- Many countries looking to improve EO monitoring capabilities
 - **SFM**
 - **REDD+**

Capacity building workshop, Lusaka

Fieldwork, Central Mozambique

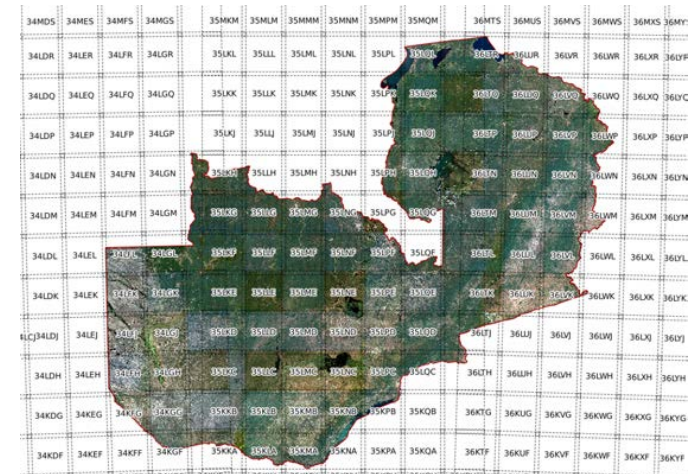

Regional meeting, Nairobi

Tool 1a/1b: Mosaicking and cloud masking

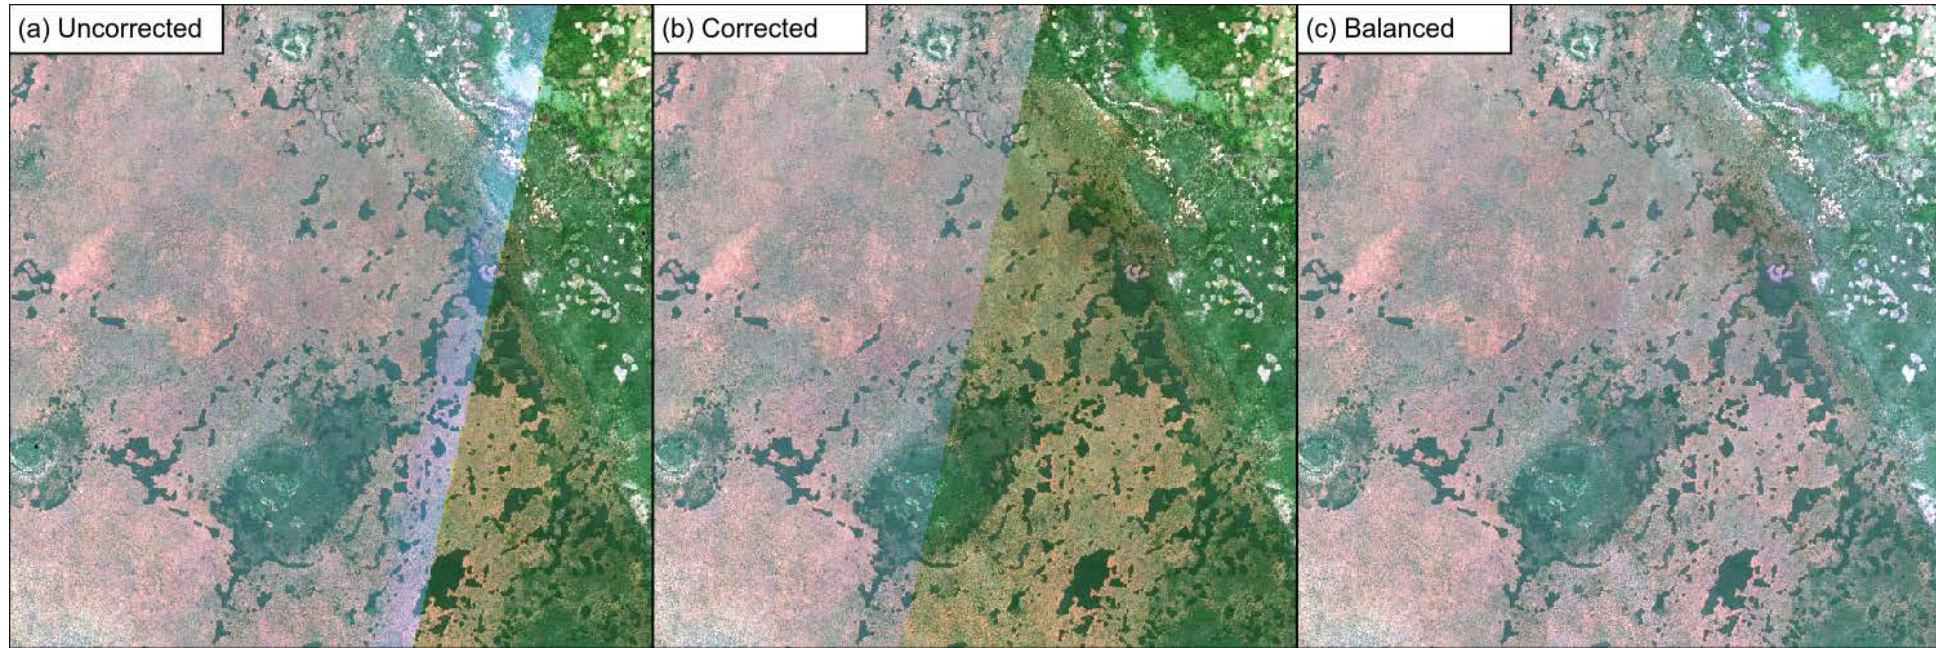

Rationale:

- Access to cloud-free images for land cover classification is difficult in most tropical dry forest countries.
- Sentinel-1 and Sentinel-2 offer free data with high resolution and strong data continuity guarantees.
- There are high barriers to making use of this data

Tool 1: Mosaicking + cloud masking

Tool 1a/1b: Mosaicking and cloud masking

Tool 2: Biomass and change mapping

Rationale:

- L-band radar is a proven technology for quantifying biomass in moderate density woodlands (Mitchard et al 2009; Ryan et al 2012, 2014; McNicol 2018)
- Free data are available through ALOS PALSAR mosaics, with low processing and storage overheads.
- Future free L-band data will be available from NISAR (NASA/India).
- Biomass change is indicative of forest change.

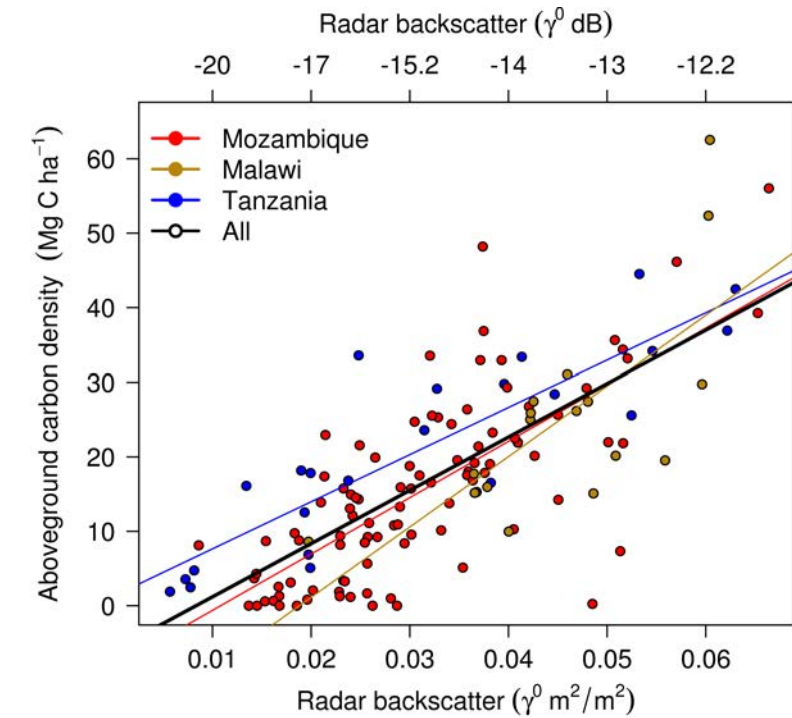

Tool 2: Biomass + change mapping

Tool 2: Biomass and change mapping

Data from Kilwa, Tanzania (McNicol, Ryan et al 2014).
1 ha permanent plots. All stems > 5 cm DBH

Tool 2: Biomass and change mapping

The BIOMass Tool for ALOS (biota):

- Downloads and manages ALOS mosaic data (free)
- Performs data pre-processing (calibration, filtering)
- Forest cover and biomass mapping
- Change detection
- Global visualisation now available:
- <https://tinyurl.com/miombo-change>

Tool 2: Biomass + change mapping

Application: Charcoal production for Maputo

Charcoal

- In most of Africa, ~90% of urban households cook with charcoal
- ~4% of GDP associated with trading of woodfuels
- Demand is focused around urban centres, with production in an expanding wave

Why?

- High energy density, especially compared to wood
- Better for indoor use
- Hot, even burn
- Tasty!

Application: Charcoal production for Maputo

High resolution optical

Application: Charcoal production for Maputo

High resolution optical

Application: Charcoal production for Maputo

High resolution optical

Application: Charcoal production for Maputo

High biomass

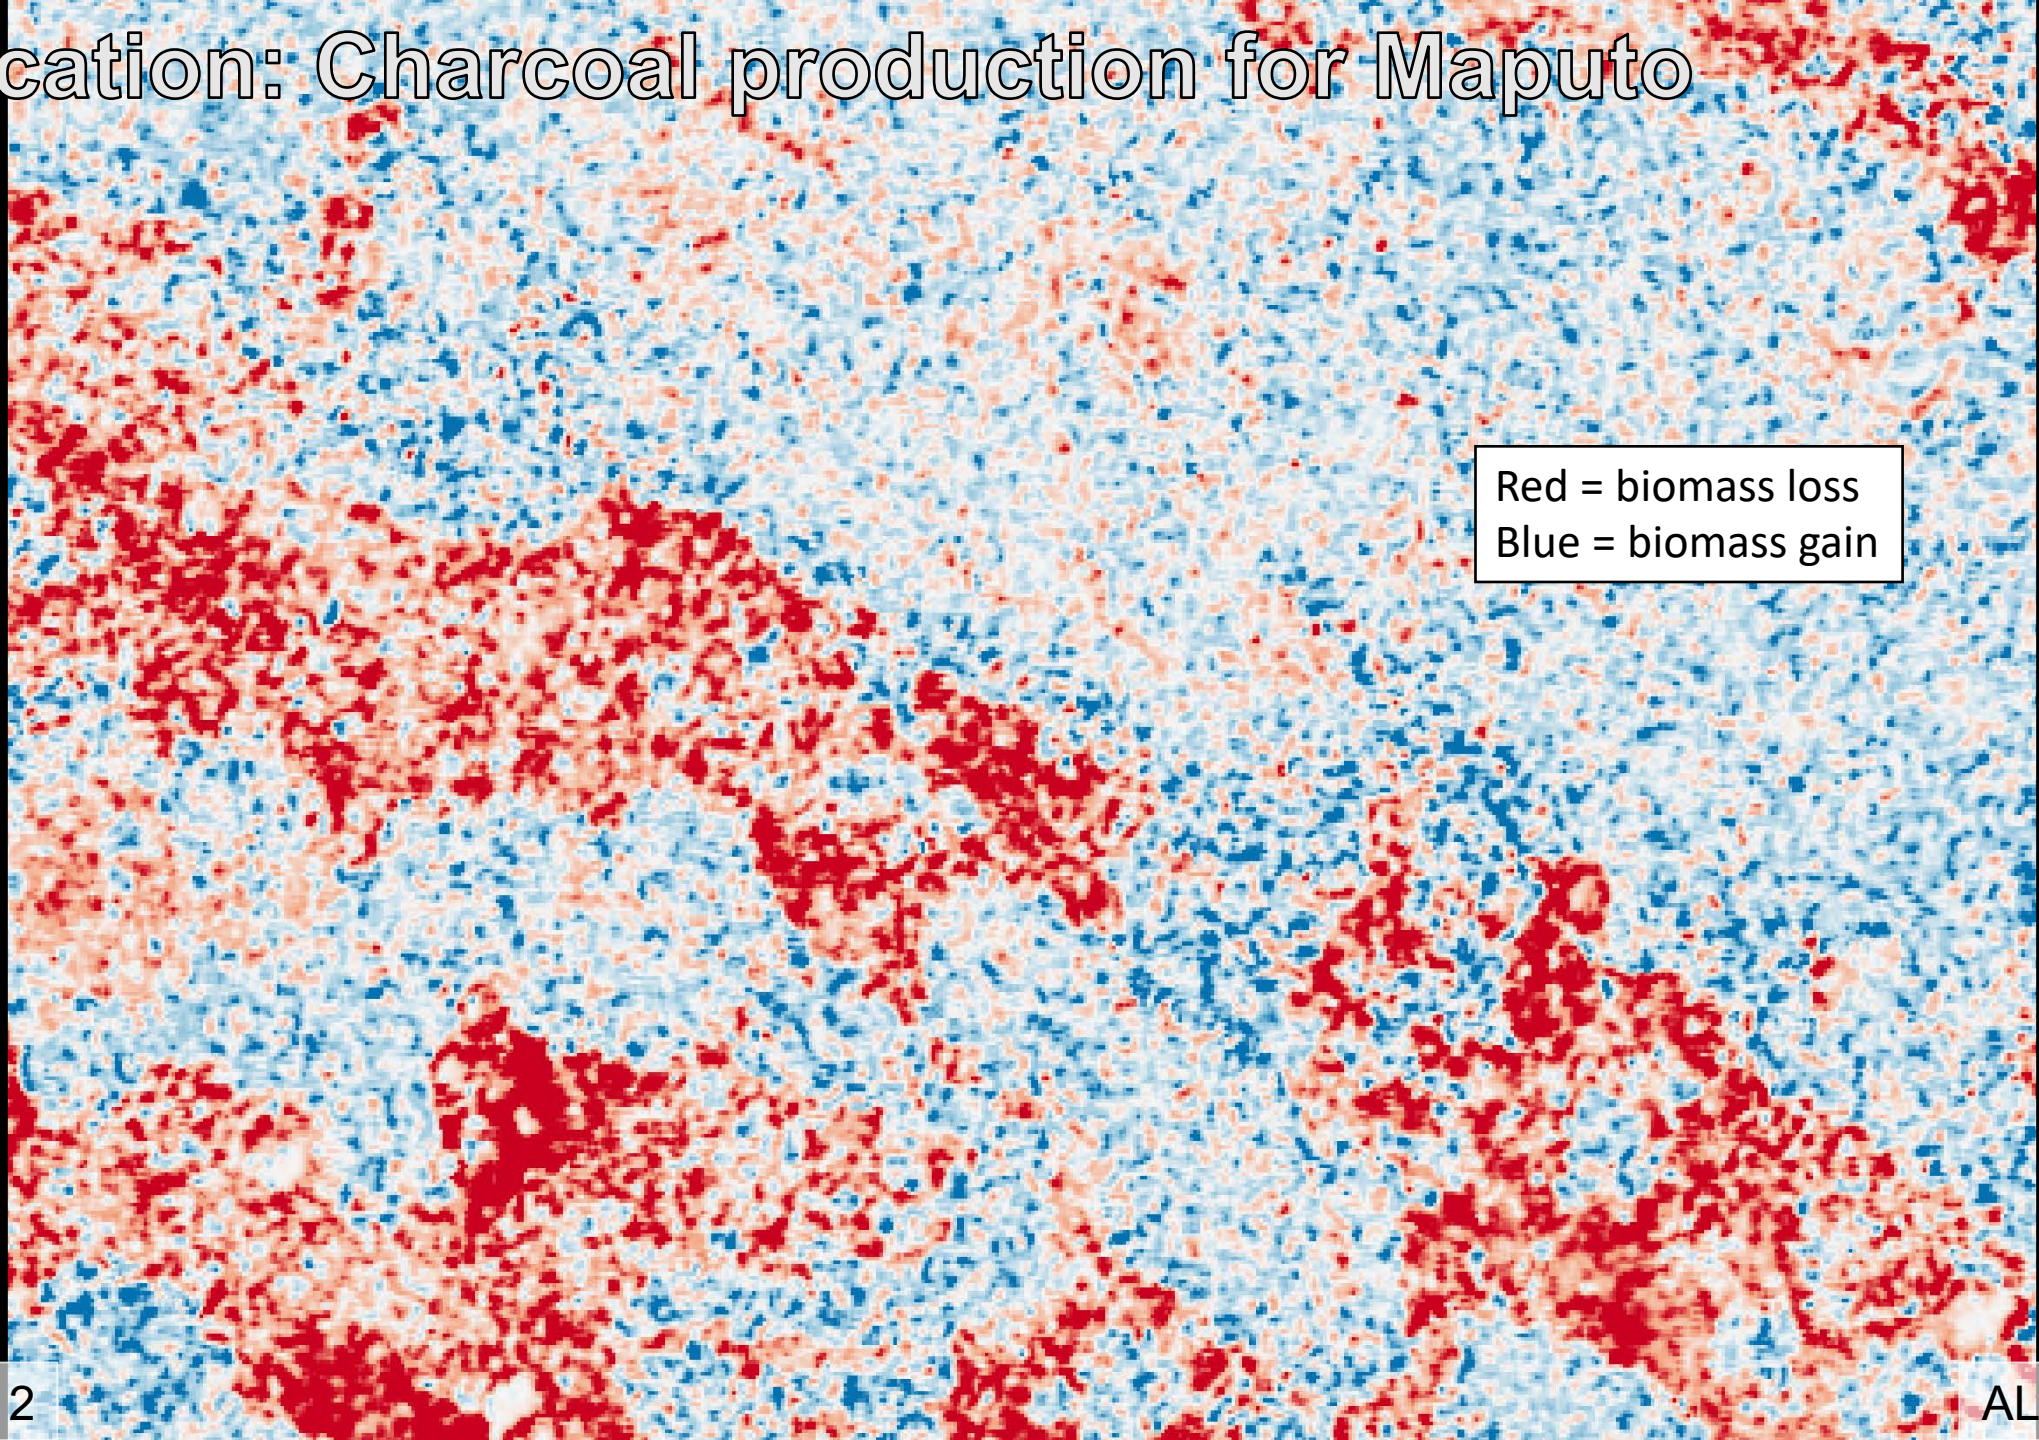

Low biomass

Application: Charcoal production for Maputo

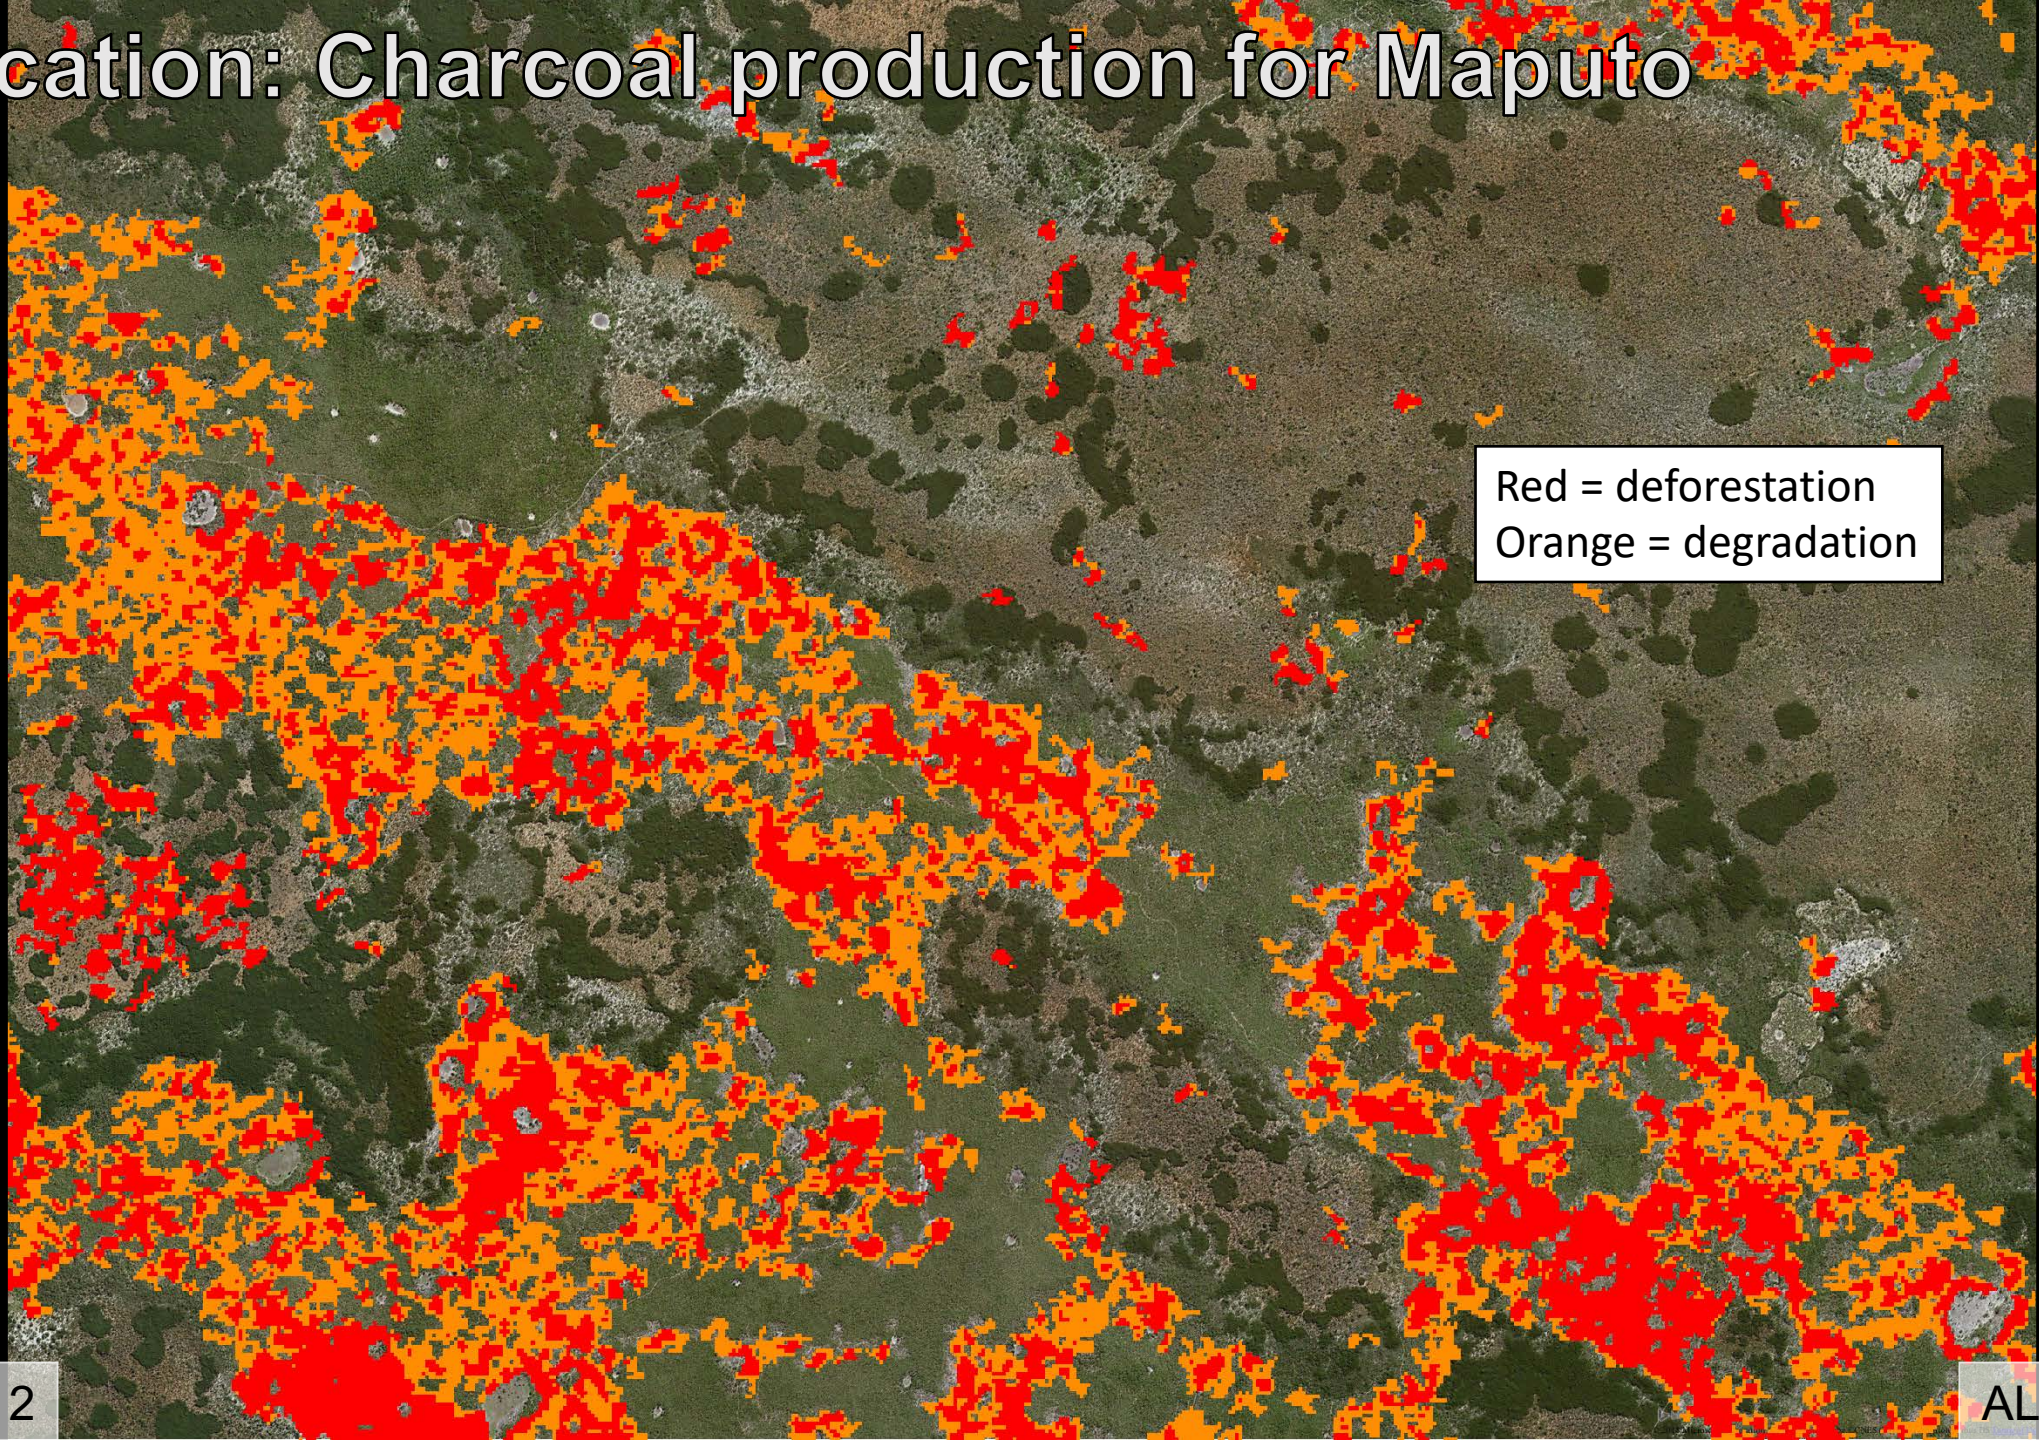

High biomass

Low biomass

Application: Charcoal production for Maputo

Application: Charcoal production for Maputo

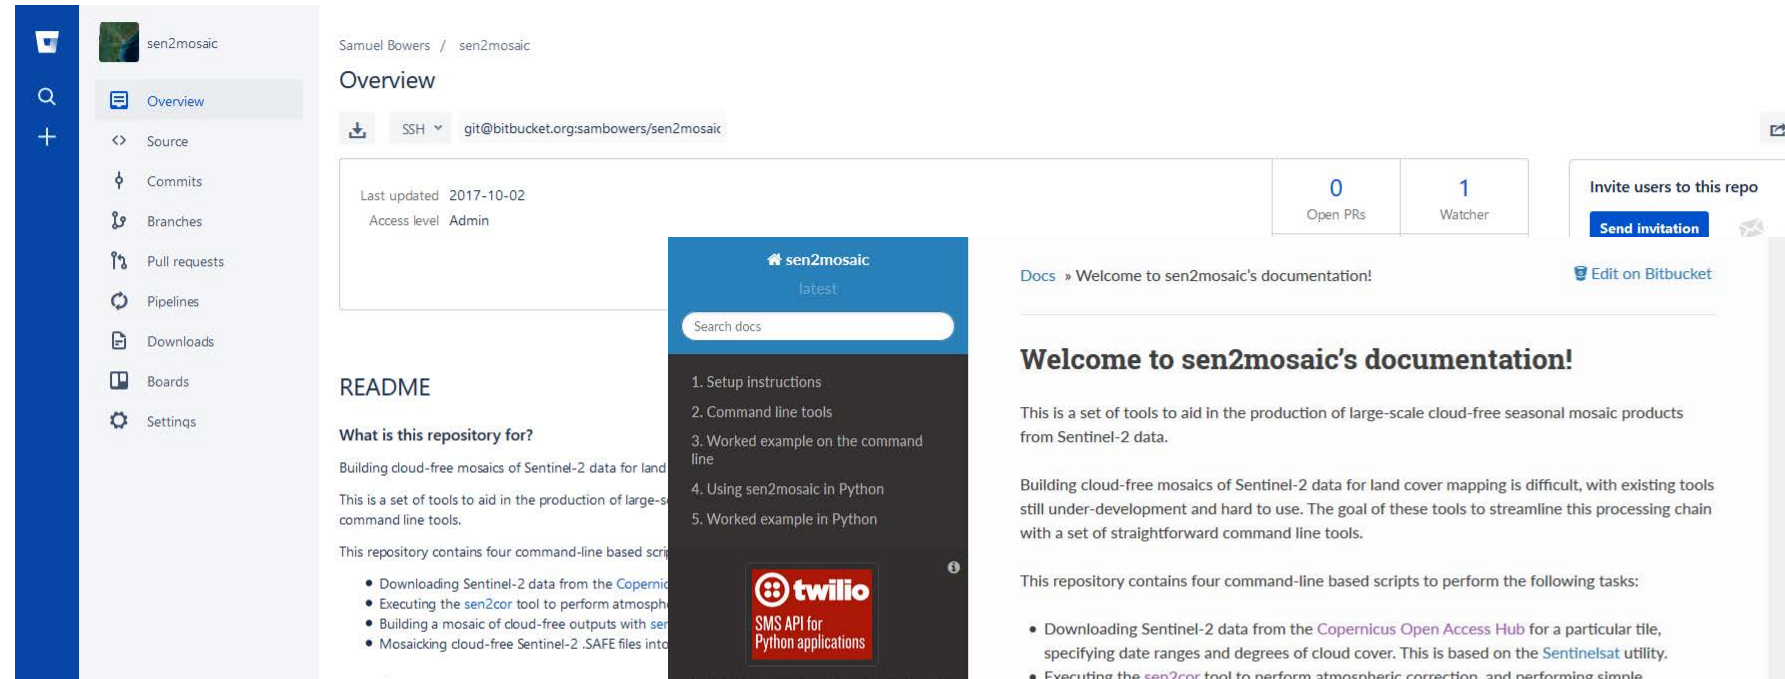

Red = deforestation
Orange = degradation

Application: Charcoal production for Maputo

The SMFM Tools

- Open source
- Generic
- Multiple interfaces
 - Python
 - Linux command line
 - Online platform (F-TEP)
 - Graphical User Interface

The screenshot shows a Bitbucket repository for 'sen2mosaic' by Samuel Bowers. The repository is public and has 0 Open PRs and 1 Watcher. The README section includes a table of contents with 5 items: 1. Setup instructions, 2. Command line tools, 3. Worked example on the command line, 4. Using sen2mosaic in Python, and 5. Worked example in Python. A Twilio logo is visible at the bottom of the README. A link to the documentation is provided: 'Docs » Welcome to sen2mosaic's documentation!'.

Tool 1b: <https://www.bitbucket.org/sambowers/sen1mosaic>

Tool 2: <https://www.bitbucket.org/sambowers/biota>

Tool 3: <https://www.bitbucket.org/sambowers/deforest> (under development)

Tool 4: <https://www.bitbucket.org/sambowers/acacia> (coming soon)

Welcome to sen2mosaic's documentation!

This is a set of tools to aid in the production of large-scale cloud-free seasonal mosaic products from Sentinel-2 data.

Building cloud-free mosaics of Sentinel-2 data for land cover mapping is difficult, with existing tools still under-development and hard to use. The goal of these tools to streamline this processing chain with a set of straightforward command line tools.

This repository contains four command-line based scripts to perform the following tasks:

- Downloading Sentinel-2 data from the [Copernicus Open Access Hub](#) for a particular tile, specifying date ranges and degrees of cloud cover. This is based on the [SentinelSAT](#) utility.
- Executing the [sen2cor](#) tool to perform atmospheric correction, and performing simple improvements to its cloud mask.
- Building a mosaic of cloud-free outputs with [sen2three](#).
- Mosaicking cloud-free Sentinel-2 .SAFE files into larger GeoTIFF files that are suitable for image classification.

How do I get set up?

These tools are written in Python for use in Linux. You will need to have first successfully installed the following:

- [Sentinelhub](#): A library for searching and downloading Sentinel-2 products.
- [Sen2cor](#): Atmospheric correction and cloud masking for Sentinel-2.
- [Sen2three](#): Synthesis of atmospherically corrected Sentinel-2 images into cloud-free composite images (version 1.1.0 or later).

The tools [sen2cor](#) and [sen2three](#) are both built around the [Anaconda](#) distribution of Python. The modules used in these scripts are all available in Anaconda Python.

Who do I talk to?

Written and maintained by Samuel Bowers (sam.bowers@ed.ac.uk).

To summarise

- Dry forests are globally extensive and under pressure.
- Many existing forest monitoring tools perform poorly in dry forests.
- The SMFM project has produced Earth Observation methods for dry forest monitoring using Earth Observation data.
- The biomass mapping tool is able to map deforestation and degradation.
- These tools are open source, and available for use in novel dry forest situations.
- Now being used by national agencies in Mozambique, Zambia (FREL) and Namibia
