

## Interplanetary Passport

Name: James  
Species: Joviod  
Home-Planet: Jupiter

### Photo

### Physical Attributes

Height: 4m vertically,  
10m(wings outstretched)  
horizontally

Weight: 100kg

Age: 15y 506 days  
Age (Earth years): 178y 235 days

### Describe

#### Communication:

*How does the Alien talk  
with other Aliens like it?  
(not necessarily via sound)*

Using the range of colour in their eyes  
Jovioids can convey complex messages  
to each other

#### Sustenance:

*Where does the Alien get their  
Energy from?*

Jovioids gain energy from diving deep into  
Jupiter and drinking the the liquid  
Hydrogen with their insect-like trunks

#### Physical Description:

*describe what the Alien looks  
like, what they're made of etc.*

- Four large wings that stretch 10m  
from end to end used for floating  
through the windy atmosphere of  
Jupiter,
- A bunch of eyes that can see  
differing wavelengths of light,  
allowing Jovioids to navigate at all  
depths,
- Multiple stretchy trunks used for  
eating/drinking

### An average day on my planet:

*Describe the general life of the Alien, what do they do day-to-day? where do they go? Where do they avoid? How long do they sleep for? How long do they stay up? How does the planet change over that day?*

Most of the time is spent floating, allowing the wind currents to blow them wherever  
If they meet another Joviod they may tell them if there is a nasty storm ahead, that  
should be avoided and they can use their massive wings to change course.  
When they fall close to the liquid hydrogen sea, they dive and drink the Hydrogen  
with their trunks.

They are more likely to be found lower down if on the night side of Jupiter and  
Higher in the atmosphere on the day side as they are drawn to the sunlight.
