

# My Forms and Facets Vessel Designs

These. are some of my vases that I have developed before I settled on the vases that are similar to each other which I will be finishing with rendering to a highest standard. I then developed the three vases by making more holes so that the flowers could be sitting in different angles.

This is the final product of my 3 vessels that will be made out of metal. I really enjoy rendering my designs as you can basically apply any materials that you like so that you can see what my vessel will look like as silverware. I designed the flowers myself using different commands e.g. bend, surface, rotate and extrude surfaces. I made the stem using the revolve command then made the green leaves using the symmetrical bend command. My Vessels are different shape vases for the flowers. I used Boolean difference to make the circle holes in the vases where the flowers can be positioned. I love how colourful the render has become. I could have made the table a different material so that the silver vases would stand out more and used less lighting. I had to change the colours of the flowers because when I used the flower material in the library as the petals on the flowers looked blurry and not like the red tulips that it was supposed to be and it was taking ages to render even when I change the resolution as shown in the images below. My technical sheet somehow came up as a link instead of my technical sheet.

I started by first doing a render of the vases with no

other objects as I wanted to  
3 vases to be the centre of  
attention.

This is my 3 final vases  
rendered on top of a wooden  
table with a couple of  
flowers to be able to show  
the use of the vases
